Loving yourself more than your neighbor: ERPs reveal online effects of a self-positivity bias

Social Cognitive and Affective Neuroscience
Eric C. Fields and Gina R. Kuperberg

Supplementary Analyses

Early Components: P1, N1, and P2

Visual examination of the waveform revealed a positivity peaking between 50 and 100 ms (the P1), a negativity peaking around 150 ms (the N1), and a positivity peaking around 250 ms (the P2).

There were no significant main effects or interactions in either the mid-regions or peripheral regions omnibus ANOVAs in the 0 – 50 ms, 50 – 100 ms (P1), or 100 – 200 ms (N1) time windows [all Fs < 3.3, ps > .05].

The P2 was analyzed as the mean amplitude between 200 and 300 ms. Both the mid-regions and peripheral regions ANOVAs showed a significant Emotion x Self-Relevance x Region interaction [F(8, 184) = 4.07, p = .005, η² = .151 and F(2, 46) = 5.06, p = .012, η² = .180, respectively]. We followed-up this interaction by examining the Emotion x Self-Relevance interaction in the frontal region, where the effect was strongest [F(2, 46) = 6.00, p = .005, η² = .207]. Here neutral and unpleasant words appeared to have evoked a larger positivity when in the other-relevant context than the self-relevant context [F(1, 23) = 3.40, p = .078, η² = .129 and F(1, 23) = 5.70, p = .026, η² = .199, for neutral and unpleasant words respectively] (see Figure 2 and Figure S1). Pleasant words appeared to evoke a larger positivity when in the self-relevant context than the other-relevant context [F(1, 23) = 4.41, p = .047, η² = .161]. However, visual examination of the grand means (Figure 2) and difference waves (Figure S1) suggested that this effect for pleasant words was, in fact, due to overlap from the following negativity.

Late Positivity (500 – 800 ms)

Results on the late positivity will be presented and discussed in comparison with the results of our previous study with the same stimuli but a different task (Fields & Kuperberg, 2012) in a future paper. This paper will focus on how task influences the allocation of attention to motivationally relevant stimuli as indexed by the late positivity. What is important to note for the current paper is that overlap from the late positivity cannot account for results in the N400 time window: the effect of self-relevance for pleasant words did not reach significance in either the full late positivity time window (500 – 800 ms) or in the smaller 500 – 600 ms, 600 – 700 ms, or 700 – 800 ms time windows [all Fs < 4.3, ps > .05]. In addition, the self-other contrast for pleasant words showed a different (more posterior) scalp distribution in these later time windows than in the 300-500 ms time window (see Figure S1).
**Figure S1.** *Self – other difference waves.*

Waveforms show the effect of Self-Relevance (self-relevant – other-relevant) for each Emotion condition. They are low-pass filtered with a half-amplitude cutoff at 5 Hz for viewing purposes.
